

# Cancer by Type

Printed from <https://www.cancerquest.org/patients/cancer-type> on 04/20/2024

Cancers may be categorized based on the functions/locations of the cells from which they originate. The following terms are commonly used to categorize tumors by their tissue (cell type) of origin.

- **Carcinoma:** a tumor derived from epithelial cells, those cells that line the surface of our skin and organs<sup>1</sup> Our digestive tract and airways are also lined with epithelial cells. This is the most common cancer type and represents about 80-90% of all cancer cases reported.
- **Sarcoma:** a tumor derived from muscle, bone, cartilage, fat or connective tissues<sup>1</sup>
- **Leukemia:** a cancer derived from white blood cells or their precursors. The cells that form both white and red blood cells are located in the bone marrow.<sup>1</sup>
- **Lymphoma:** a cancer of bone marrow derived cells that affects the lymphatic system<sup>1</sup>
- **Myeloma:** a cancer involving the white blood cells responsible for the production of antibodies (B lymphocytes or B-cells).<sup>1</sup>

Cancer affects millions of people every year. The National Cancer Institute provides current statistics on cancer cases and cancer deaths across the United States.
